

# How to install vselect command

Travis Cao

April 13, 2021

For Problem #3 on PS 10, you'll need to use the `vselect` command in Stata to choose what variables to include in your linear regression model.

However, `vselect` doesn't come preinstalled. So to install this command, you'll need to run the following line in Stata:

```
net install https://www.stata-journal.com/software/sj15-1/st0213_2.pkg
```

This line installs the `vselect` command into your Stata software, and you can then proceed to run the commands provided in your problem set.

If you have any question related to the command's syntax, remember to first try looking up its help document by running

```
help vselect
```
